Chapter 7 Instrumental methods in organic chemical analysis Instrumental methods have been covered in a number of monographs and text books. As these methods have been applied mainly in the analysis of organic compounds, it seems justified to give a short survey here in order to demonstrate their usefulness in combination with chemical methods for the identification of unknown organic compounds.

Infrared (IR) spectroscopy is a simple, rapid, and nondestructive instrumental technique that can give evidence for the presence of various functional groups. If you had a sample of unknown identity, among the first things you would do is obtain an infrared spectrum, along with determining its solubility in common solvents and its melting and/ or boiling point.

During this period significant contributions to analytical chemistry include the development of systematic elemental analysis by Justus von Liebig and systematized organic analysis based on the specific reactions of functional groups. The first instrumental analysis was flame emissive spectrometry developed by Robert Bunsen and Gustav Kirchhoff who discovered rubidium (Rb) and caesium (Cs) in 1860.
